IS 4487 – Personalized Learning Outcomes SubmissionTwo New Learning Outcomes

1. Use Python to clean, visualize, and run basic models on customer and campaign data so I can build usable segments, judge whether a marketing effort actually worked, and recommend targeting decisions that improve conversion and return on ad spend.
2. Turn those results into recommendations a marketing team could use, connecting the analysis to customer lifetime value and campaign strategy while addressing privacy, bias, and the ethical limits of consumer data.

These are relevant because they keep the course’s core skills—Python, problem framing, visualization, modeling, communication, and ethics—and apply them to the marketing problems I am most likely to see in internships and early jobs.

Reflection: I created the two outcomes above after reviewing the syllabus and working through a conversation with the Tutoring Bot. The official course outcomes already cover Python, the analytics process, wrangling and visualization, framing a problem, communicating results, and ethical data use. What they do not do is tell me how those skills connect to marketing. That was the gap I was trying to close. I started the Bot with “Help me customize my learning outcomes.” It asked about my major, career goals, why I took the course, the problems I care about, and my background. I said I am a Marketing major and that I want to work in digital marketing or marketing analytics. I enrolled because internships keep listing data skills I only partly have. I have used Excel and dashboards, but Python is still new. The

problems I keep thinking about are customer segmentation, campaign performance, and how companies decide who to target. The first drafts were the weakest part of the process. One was too generic: basically “use analytics to support marketing.” That could have come from any business class. The next swing went the other way and sounded like a data-science course I have not taken yet, with advanced churn modeling I am not ready to claim. What did not work was accepting those drafts as-is. What did work was asking the Bot to stay inside this course and only change the setting. I told it the first outcome needed an actual marketing decision, not just “analyze data.” I told it the second outcome needed to sound like something I would have to present to a manager, including customer value and ethics. After two revisions, the ideas were solid enough that I rewrote them in my own wording. That last step mattered. The Bot got me to a useful direction; I still had to make the language sound like a goal I would actually use. These outcomes matter to my major because marketing is moving toward measurement. Knowing the language of targeting is not the same as being able to take a messy customer file, clean it, visualize lift by segment, and say whether the campaign was worth it. That is the skill I am missing. They also matter to my career plans because I do not want to be the person who hands every data question to someone else. I want to be able to sit in a meeting, understand the analysis, and recommend a next step. The ethics piece is personal too. If I work with customer lists and campaign data, I do not want to treat people as rows in a spreadsheet. Being able to talk about bias, privacy, and whether a targeting model should be used is part of doing the job well, not an extra comment at the end. I am going to use these two outcomes as a filter for later assignments. If I am wrangling or modeling, I will ask whether the work helps me evaluate a marketing decision. If I am writing or presenting, I will ask whether a marketing manager could act on it and whether I addressed the ethical side. That is how I plan to keep the course connected to the work I actually want to do.

Conversation with the Tutoring Bot
Student: Help me customize my learning outcomes.
Bot: I can help you adapt the course outcomes to your goals. What's your major, or what fields are you considering? What are your career interests? Why did you take this course? Are there specific industries or problems you care about? What experience do you already have with data or programming?
ME: Marketing major. I want to go into digital marketing or marketing analytics. I took the class because internships keep asking for data skills I don't really have yet. I'm interested in customer segmentation, campaign performance, and e-commerce targeting. I've used Excel and some dashboards. Python is still new.
Bot: Here are two first drafts:

1. Use Python to clean and visualize customer and campaign data in order to identify segments and measure marketing performance.
2. Communicate analytic findings to marketing stakeholders and consider ethical issues in consumer data.

Do you want these more specific?
ME: The first one is too broad. It doesn't say what I would actually do with the analysis. Add basic modeling and a real decision, like targeting or ROI. The second one sounds like a syllabus sentence. I need it to sound like something I would present to a marketing manager, including customer lifetime value and ethics. Keep it at this course's level, not advanced machine learning.
Bot: Updated versions:

1. Apply Python-based data wrangling, visualization, and basic predictive modeling to customer and campaign datasets so I can segment audiences, evaluate marketing performance, and recommend targeting decisions that improve conversion and return on ad spend.
2. Translate analytic results into clear, ethically grounded recommendations for marketing stakeholders, connecting model outputs to customer lifetime value, campaign strategy, and responsible use of consumer data.

ME: That's the right direction. I'm going to rewrite them slightly so they sound like me, but I'm keeping this split: one outcome for doing the analysis, one for explaining it and dealing with the ethics.
Bot: That

split works. Keep both visible for later assignments so you can show how each deliverable connects back to your own outcomes.
